Web Scraper Style Guide

White Space:
- White space was used to organize our code. The use of 4 spaces or an indent allowed us to see which code was a part of which section. Since our project was over 800 lines this was needed in order to keep everything organized.
- We used indents when code was in a function to establish which function the piece of code was in. As well as if the code was a part of a loop.
- There are also one line spaces between each function which makes sure that there aren't too many things clumped up or too far spread out.

Comments
- We used comments to make sure we still knew what each part of the code did and when we went back through the code that we understood each and every role.
- Comments were also used to describe each function which allowed for better organization
- Comments can clearly be denoted with the /*
- At the top a comment block is used to show the title of the code as well as who coded it

Naming Conventions
- The variable names used are appropriate and follow the standard guidelines when using naming variables.
- The functions are also named appropriately and relate to the designated role of that function.
